

YEAR 12 BIOLOGY EXCURSION

Last week, our Year 12 Biology students took part in their final school excursion, visiting the Museum of Human Disease.

Throughout the day, students explored the multifaceted nature of disease, investigating both infectious and non-infectious conditions. They examined the influence of genetics, environmental factors, and lifestyle choices, gaining valuable insight into the complex causes of health outcomes.

The excursion offered an incredible opportunity for students to connect classroom theory with real-world examples. By studying how inherited traits and genetic mutations can shape susceptibility and resistance to disease, students were able to deepen their understanding of key concepts in preparation for their final studies.
